

360 Automation

Commercial Introduction

360 Automation

PLC Maintenance:

Your [programmable logic controllers \(PLC\)](#) are critical to the smooth operation of your factory. That's why it's very important that they are up and running at peak efficiency every day. If any part of your PLC goes down, you may need to repair it or at least replace a part or two to sustain PLC functioning. One of the most important ways to keep up with a PLC system is with regular maintenance.

1. Preventive maintenance

Preventive maintenance of programmable controller systems includes only a few basic procedures, which will greatly reduce the failure rate of system components. Preventive maintenance for the PLC system should be scheduled with the regular machine or equipment maintenance, so that the equipment and controller are down for a minimum amount of time.

2. Spare parts

It is a good idea to keep a stock of replacement parts on hand. This practice will minimize downtime resulting from component failure.

360 Compression service can provide you spare parts in short time in order to support you for replacement.

3. Replacement of I/O modules

Our Automation specialist can replace modules and guarantee the proper functionality and warranty.

If your PLC should go down and is clearly in need of repair, you need to take care of it quickly. Call 360 Compression Services at 832-499-2821 or [contact us online](#) for fast and affordable **PLC repair** that will have you back up and running as fast as possible.

Instrumentation Maintenance:

Gain measurement confidence and save costs while meeting your compliance requirements

Our certified service technicians provide in-depth verification of measuring instruments with documented proof of compliance, giving you the confidence that your instrumentation is functioning correctly.

Benefits

- Measurement confidence from rigorous diagnostic testing
- Reliable, safe operations from verified instrumentation
- Documented compliance from fully traceable verification

Our offering

We bring proven instrumentation and maintenance knowhow to deliver a comprehensive functional assessment of instrument reliability that enables you to meet all necessary compliance requirements, reduce unplanned downtime, and optimize maintenance costs:

- Minimize process interruption with inline verification
- Reduce risk with reliable instrumentation performing according to functional and safety specifications
- Fulfil regulatory, quality and safety requirements with documented verification traceable to international standards
- Combine verification with calibration for enhanced device reliability and metrological performance
